

ABSTRACT

1

2

3 A window for gating light for the purpose of controlling temperature within a  
4 building, comprising a light transmissive substrate, a plurality of at least partially  
5 reflective rollout members disposed on said substrate, the rollout members being  
6 responsive to a source of electrical potential to cause the rollout members to rollout,  
7 and an electrically conductive at least partially light transmissive conductive  
8 member disposed in facing relationship with said reflective rollout members and  
9 said substrate.
